

I would like to make one more comment regrading this matter. You will note the nature of complaints from the VSAT people regarding interference from radar detectors. Please understand that this items are not intending to radiate RF. Instead this is a very weak signal that is basically accidental in nature. Still it is an interference problem for these VSAT systems. Enough of a problem where techs are called out. It is along enough problem that is still exists when the techs arrive.

One would therefore assume that any signal that is an intended and modulated radiation would even interfere worse. That is the point here.

Please reject the SAVI's proposal as being technically flawed. They obviously have a very excellent sales force. Let them get as good of engineering force. Then they truly can help our nation's economy and defence. As it is by deploying this system they would be giving aid and comfort to the enemies our of nation.
